We analyze Malthus' (1798) model when labor demand shifts persistently. The Malthusian ideas are formalized and...
derived in terms of stationarity and cointegration, and the implied restrictions are tested against English pre-industrial data 1560-1760. The evidence suggests a negligible marginal productivity effect of population on real income, implying that the Malthusian "check" relations should be analyzed as cointegrating relations. The data support highly significant preventive checks working via marriages, but weak (in-significant) positive checks. These results are remarkably clear-cut. We suggest a simple interpretation for the lack of response of real income to population, which is consistent with positive feed back effects from population on technology, à la Boserupian- and/or Smithian mechanisms. Recursive estimation confirms stable parameters and identify the end of our modified Malthusian regime.

Indian Railways in the Past Twenty Years Issues, Performance and ChallengesDate: 2008-07-15

By: Raghuram G. Gangwar Rachna

Indian Railways (IR) is Asia’s largest and world’s second largest network under one management, with a separate Ministry and its own annual budget. The network carried about 17 million Passengers and 2 mt freight every day on the route of 63,327 km (2006-07). Although key business operations are freight and passenger, IR is also engaged in several allied services including parcel, catering and production units. Nearly 70 percent of IR’s revenues come from the freight operations, which can be segmented into bulk and other cargo. Over the years, IR has predominantly become a bulk freight carrier, accounting for about 94 percent of the freight revenue. Coal alone accounts for nearly half of the bulk traffic carried. Passenger business accounts for nearly 60 percent of IR’s total transport effort, in terms of train kilometers, but yield less than 30 percent of the total revenues. Suburban services account for 57 percent of the originating passengers, while contribute to only 8 percent of the passenger revenue. To understand the development process of IR’s over the past twenty years, the study covers issues and strategies related to financial and physical aspects of revenue generating freight and passenger traffic from 1987-2007. Study also covers the developments in the parcel, catering and advertising sector.

Institutions and government growth: a comparison of the 1890s and the 1930s

Statistics on the size and growth of the U.S. federal government, along with the rhetoric of President Franklin Roosevelt, seem to indicate that the Great Depression was the event that started the dramatic growth in government spending and intervention in the private sector that has continued to the present day. Through a comparison of the economic conditions of the 1890s and the 1930s, we argue that post-1930 government growth in the United States is not the direct result of the Great Depression, but rather is a result of institutional, legal, and social changes that began in the late 1800s.

A growing body of literature (Johnson, 1972; Tyson, 1990; Fleischman and Parker, 1990 and 1991; Edwards and Newell, 1991 and Fleischman et al., 1996) has evidenced that sophisticated costing techniques were used in the early stages of the Industrial Revolution for efficiency reasons. However, some scholars have questioned the role of efficiency (Hoskin and Macve, 1988; Miller, 1994, Carmona et al., 1997, 1998 and 2002 and Gutiérrez et al., 2005) and have suggested institutional explanations for the development of cost accounting. The purpose of this research is to extend this institutional explanation of accounting spreading in the second half of the 18th century, Enlightenment Century Spain. With this aim, this work explores the changes that took place in six organizations depended of the Crown. The study reveals the importance
of the role played by a group of managers belonging to the
Spanish Enlightenment Movement.

Might Australia Have Failed? Endowments, Institutions and
ContingencyDate: 2007-12

By: Ian McLean (School of Economics, University of
Adelaide)

Some of the hypotheses regarding the role of institutions in
long-run growth which have recently been advanced in the
growth and history literatures imply that, given its initial
conditions, Australia in the nineteenth century should have
acquired quite different economic (and political) institutions
from those it did, leading in turn to lower long-term growth
rates than it actually achieved. In accounting for why this
did not occur in Australia, it is suggested here that the
emphasis in these literatures on both initial conditions and
on institutional persistence is misplaced relative to the
importance of institutional innovation, adaptation, and even
disappearance. The mechanisms linking initial endowments
and institutional change in Australia are complex, with
timing, sequence, and chance playing a prominent role. The
economic institutions examined in this paper are the
markets for convict and indentured labor, and the property
rights in – and conditions of access to – the abundant natural resources (land and gold).

The British tripartite financial supervision system in the face of the Northern Rock run

Date: 2008

By: Sharon Blei

The Northern Rock debacle - Britain's first bank run in 141 years - was the Tripartite regulatory system's first live ammunition test since its establishment in 1997. The aftermath of the crisis lists the destruction of Britain's fifth largest mortgage lender, the tarnishing of the Bank of England's well-established reputation, and the loss of confidence in the reformed regulatory system - a system that had been considered a paragon by policymakers and reformers around the world. As market observers, politicians, investors and bankers criticize not only the mortgage lender for its extreme business model - but also the Tripartite regulatory system for mishandling the crisis - it is important to piece the story together and draw lessons from it. This paper examines the Tripartite's management of the crisis and concludes that the separation between the roles of banking supervision and Lender of Last Resort,
coupled by Britain's flawed deposit insurance scheme, account for the British regulatory system's mishandling of the funding shortage that escalated into a bank run.

Using a newly-constructed panel data set which includes annual estimates of lending rates for 47 Japanese prefectures, we analyze why interest rates converged over the period 1884-1925. We find evidence that technological innovations and institutional changes played an important role in creating a national capital market in Japan. In particular, the diffusion in the use of the telegraph, the growth in commercial branch banking networks, and the development of Bank of Japan's branches reduced interest-rate differentials. Bank regulation appears to have played little role in impeding financial market integration.
Economic development in East Asia is characterized by the sequential "take-off" of member countries. This multi-tiered economic development in East Asia is often termed the "Flying Geese" pattern of economic development. However, some authors argue that the traditional Flying Geese pattern is not applicable to some industries such as electronics. Here, Japan may no longer be the sole "leading goose", with "followers" such as China (now producing cutting-edge products) having "caught-up". Does this mean that the Flying Geese Model has become "obsolete" in the 21st century? The main objective of this paper is to clarify the two concepts of Flying Geese which now seem confused: (1) application of the pattern of economic development in one specific country, and (2) application of the pattern of economic development to multiple countries in sequence. This paper provides validity checks of Flying
Geese Models after differentiating these two concepts more clearly

La Economía, como tema de cátedra universitaria y área del saber, parece haberse consolidado durante el siglo XVIII en Europa, conociéndose inicialmente como economía política. Fue solo hacia 1900 cuando el término 'economía' comenzó a popularizarse. La Universidad Javeriana ofreció la primera carrera universitaria de economía en Colombia a través de su Facultad de Ciencias Económicas y Jurídicas fundada en 1931, cuyo programa tenía una duración de cinco años en el cual, dependiendo del programa escogido, el alumno podía recibir el título de doctor en Ciencias Económicas, doctor en Derecho, o doctor en Ciencias Económicas y Jurídicas.
